

## Controversy rages wildly.

### We just don't know.

Those who believe that Evolution is science, can not be regarded as scientists, as they lack a probing mind by ignoring the details, namely micro cellular intricacies, fail to support their expressed views with crucial scientific evidence, and may even believe in god or foster some religious affliction contrary to the purely materialistic foundation of Evolution.

This makes them shallow, uninformed and hypocrites.

Science, observation, evidence and common sense all point toward spontaneous and sudden existence of fully formed complex species, and away from gradual evolution from lower kin, and that, subtle and micro mutations are due to traits hard-wired within every cell of every organic matter, with specific functions and timeline to steer the path of its full cycle of life including growth, reproduction even metamorphoses, making adaptive adjustments as needed and *never* result in creation of another superior or inferior species.

Contrary therefore to the unfounded claims that "all living things are evolved", we can declare with

confidence that NOTHING IN THIS WORLD IS THE RESULT OF EVOLUTION no matter how much time or how favourable the nature.

I can only regret the ignorant assertions and claimants to the knowledge of existence, be it the self proclaimed messengers of the divine through the scripture and the like, or worst still, the myopic self venerated scientific community who in their delirium still latch on to the fallacy that undirected and freak mutation within the cell favoured by merciless external nature is the architect of the grandeur we know as life and savour as living experience.

From fungus to the human mind, and from nanoparticles to orbiting stars, I witness and experience perfection in structure, performance, diversity and order which can only suggest an intelligently contrived manifestation. Who or what is behind it, I don't know, I don't think I *can* know or even afford to speculate, lest projection and regurgitation of my own preconditioned notions.

In that, I pay kudos to the wisdom of Omar Khayyam Persian poet and mathematician, whom best reflected the futility of this pursuit in his 900 years old quatrain.

Some people ponder the province of faith and pray  
Others torn between fantasy & reality along the way

I fear the warnings of the inner voice to my dismay  
"Beware the unaware", for, both paths will lead astray (my translation)
